

data sheet **Oracle Policy Manager**

Oracle Policy Manager release 8.1.7 is the new GUI administration tool for Oracle Label Security™. Administrators can use Oracle Policy Manager to create sensitivity labels, manage Oracle Label Security user authorizations and protect tables or schemes. Oracle Policy Manager release 9i will also support the management of user defined Oracle Virtual Private Database (VPD) policies.

ORACLE POLICY MANAGER 8.1.7 ORACLE LABEL SECURITY MANAGEMENT

Oracle Policy Manager is the tool for managing Oracle Label Security. Oracle Label Security is a powerful new security solution for protecting critical data. Oracle Label Security is built on the same technology as VPD. Oracle Label Security is based on labeling concepts used by government and defense organizations to protect sensitive information and provide data separation. Oracle Label Security is an out-of-the-box row level security solution. No software development is necessary when using Oracle Label Security. In addition to being highly valuable in government and defense organizations, Oracle Label Security is designed for use in commercial industries such as healthcare, law enforcement, financial services and defense.

Administrative Interface

Define Labels and Components

Oracle Label Security labels are comprised of levels, compartments and groups. Oracle Policy Manager can be used to define the label components and build valid labels. Examples of levels include public, confidential, sensitive, highly sensitive. Examples of potential compartments include financial, trade secret, physician. Examples of groups include US, NATO, UK, Western Region. Labels are comprised of a level and optionally compartments and groups. For example, Oracle Policy Manager could be used to define the label Confidential : Physician.

Protect Tables and Schemes

Oracle Label Security allows multiple policies to be created within an Oracle database. Oracle Policy Manager is the GUI tool for creating the policies. Once policies are created, they can be assigned to individual tables or entire schemes using the Oracle Policy Manager.

Policy Customization

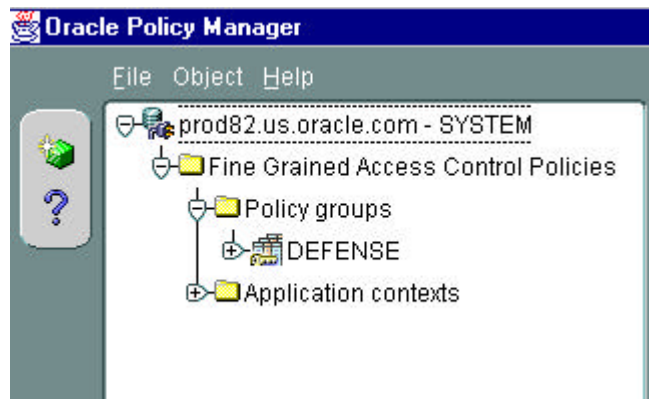

Oracle Label Security has an array of enforcement options which can be set on a per policy basis. Using Oracle Policy Manager, administrators can easily specify which enforcement options should be set for each policy. Enforcement options include enforcement on read operations, write operations, and update operations on the label.

Manage User and Program Unit Authorizations

Oracle Label Security authorizations are granted through labels and privileges. Labels and privileges can be assigned to application users. Privileges can be assigned to stored program units. Oracle Policy Manager is the GUI tool for managing authorizations. Read and write authorizations on compartments and groups can be customized on a per user basis. For example, a user could be authorized to read data labeled Confidential : Physician, but not perform updates. An array of Oracle Label Security privileges can be managed through Oracle Policy Manager. These include write up, write down and write across for manipulating labels. The profile access privilege allows a designated user to assume the authorizations of another user. This is particularly useful for security administrators. The read and full privileges allow administrative and operational reports to be generated without compromising individual user authorizations. The Oracle Label Security feature overview contains detailed information on enforcement options and privileges.

ORACLE POLICY MANAGER 9i VPD MANAGEMENT

Security administrators will be able to use Oracle Policy Manager 9i to manage enforcement of VPD security policies. Policy groups, a VPD feature, can be defined in Oracle Policy Manager for easy management where multiple policies must be enforced on a single application table. A policy group is a descriptive name which is used to identify one or more VPD security policies. VPD security policies are stored program units defined by information security officers and stored in the Oracle database. The security policies are appended to requests submitted by application users. Using Oracle Policy Manager, a security administrator can easily control policy enforcement in a GUI environment. For example, suppose a policy is created which restricts data access based on the sales territory to which a user is assigned. Using Oracle Policy Manager, an administrator could apply the policy to an application table quickly and easily without modifying the production application code.

Oracle Policy Manager 9i VPD Administrative Interface

MANAGE SECURE APPLICATION CONTEXTS

The Oracle9i secure application context is a powerful addition to the Virtual Private Database technology. Secure application contexts provide sophisticated access control capability. The application context, like the VPD policy group, can be defined using the Oracle Policy Manager. When an application context is created, it should be assigned a descriptive name for easy reference. In addition, an Oracle9i package must be designated as the package responsible for the maintenance of the secure application context. The assignment of a specific package for maintaining the context provides centralized security for the context. Oracle Policy Manager 9i will be the GUI interface for controlling application context access and initialization methods.

KEY FEATURES

Oracle Label Security Management

- Manage policies and enforcement options
- Define data labels and label components
- Protect tables and schemes
- Manage Oracle Label Security user authorizations and privileges
- Manage Oracle Label Security auditing
- Authorize Trusted Stored Procedures

Application Context Management

- Define application contexts
- Assign trusted packages for managing application contexts
- Control application context accessibility

VPD Management

- VPD management
- Define VPD policy groups
- Assign policy groups to application tables

RELATED PRODUCTS AND SERVICES

Oracle Policy Security is part of the Oracle Enterprise Manager framework.

GETTING STARTED

Oracle Policy Manager is provided at no cost with the Oracle Enterprise Edition. Oracle Virtual Private Database is included at no-cost with the Oracle Enterprise Edition database. Oracle Label Security is an add-on option available with the Oracle Enterprise Edition release 8.1.7. Oracle Policy Manage VPD Management is an Oracle9i feature and is not available in release 8.1.7.
